

MMTA Course Three – Geocosmic Correlations to Primary and Trading Cycles in Financial Markets

FORECASTING REVERSAL DATES IN VARIOUS FINANCIAL MARKETS – PRACTICES USING CURRENT MARKETS

Module Lesson Fourteen

The purpose of this lesson is to apply these methods to current markets and forecast an ideal date for a forthcoming primary cycle trough or crest. In addition, we will construct a trading plan on buying or selling this set up, if it occurs, within the next three-star critical reversal date time band.

In this lesson, you will perform the following analysis in each market:

1.) Identify when the current primary cycle began

2.) Identify the time band when its current primary cycle is next due to bottom

3.) Identify the phases already completed within the current primary cycle and when the next one is due

4.) Identify when the primary cycle crest is due (if known)

5.) Identify when the crests of the phases of the primary cycle are due

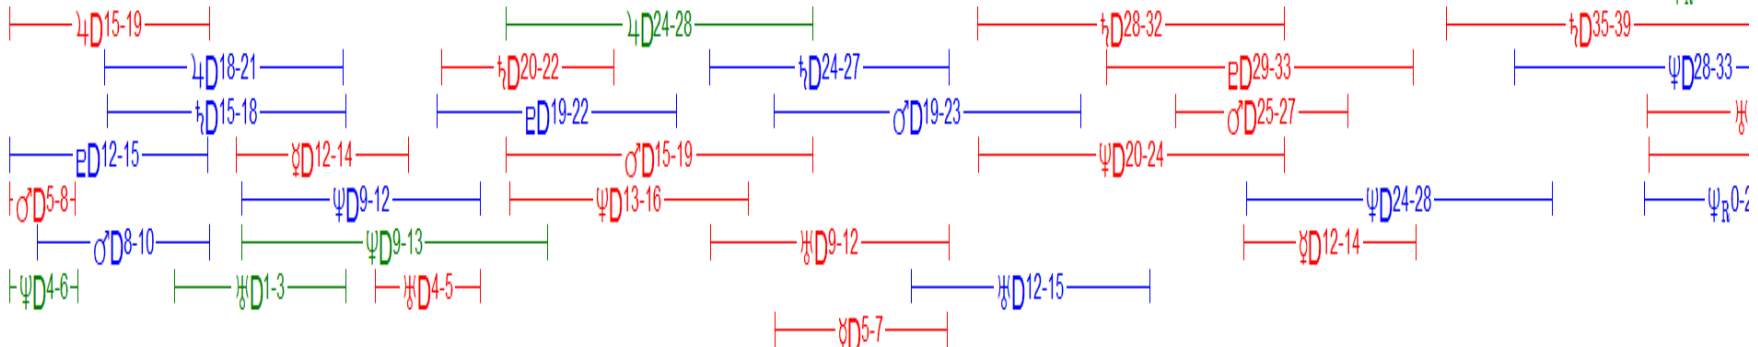

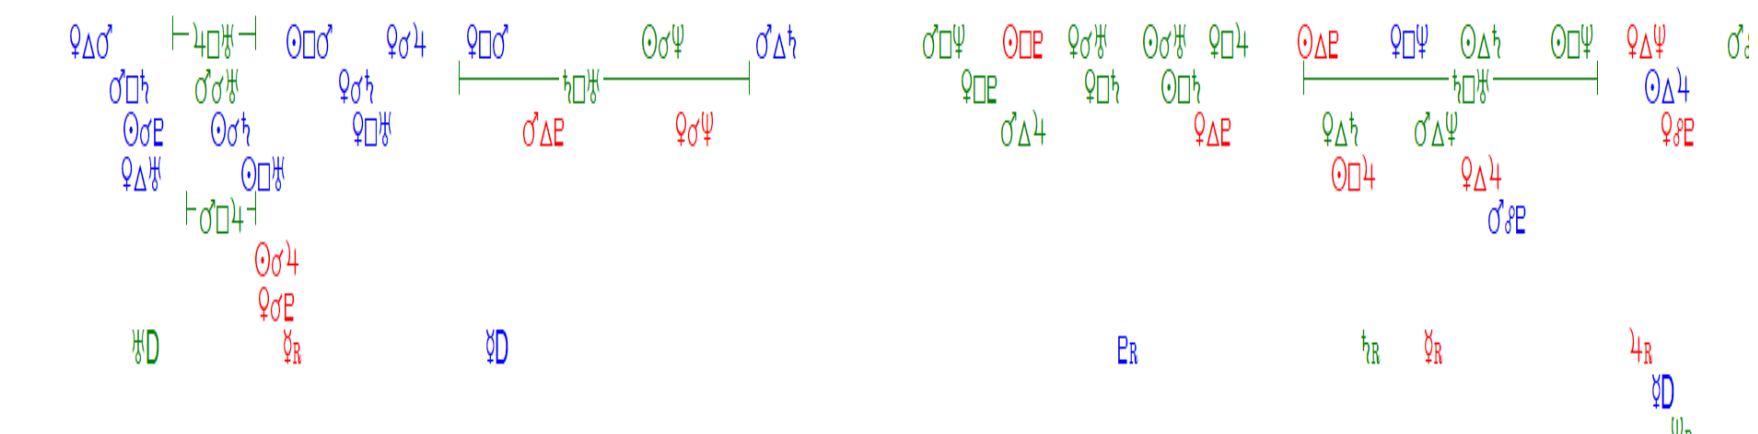

6.) Identify the chart pattern of the current primary cycle (2-phase, 3-phase, or combination)

7.) Speculate or identify what translation pattern will be in effect for the primary cycle

8.) Calculate the price target for the next corrective rally or decline to a major, half-primary, and/or primary cycle

9.) Speculate on what type of oscillator or chart pattern would form in the forthcoming primary cycle and nearby to the next **CRD**

Let's the following markets, decide which are in a time band for a primary cycle as this CRD comes due:

- **Dow Jones Industrial Average**
- **Euro Currency**
- **T-Notes**
- **Crude Oil**
- **Soybeans**
- **Gold**
- **Silver**
